

Lesson 1: Learning Segment Central Focus or “Big Idea”:

The central focus of this learning segment is to get students to be able to play in a competitive tennis rally. The focus of this specific lesson is the forehand groundstroke, specifically the psychomotor aspects of the forehand groundstroke and the cognitive knowledge of how to perform the forehand groundstroke. Students will also gain an understanding of why the cues are essential to the forehand.

Grade: 9**Content Area: Physical Education/Tennis****TEACHER: Mr. Jaymot****Students: 47****Time Allotted: 60 Minutes****Classroom organization:**

1. Roll call numbers
2. Tennis Courts
3. In self-space in-between the basketball gym and the tennis courts (large blacktop space)

Resources and materials: 50 tennis racquets, 200 tennis balls, 20 foam balls, 20 low compression balls, Over grips, Permanent marker, dry-erase marker Portable white board, tennis backboard or a long wall, daily learning objective rubric spreadsheet, peer assessment worksheet assignment, 50 pencils, poster board visual for the forehand grip, ball hoppers or buckets

California Content Standard(s):

1.2 Demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.

1.3 Identify, explain, and apply the skill-related components of balance, reaction time, agility, coordination, explosive power, and speed that enhance performance levels in aquatic, rhythms/dance, and individual and dual activities.

1.7 Analyze and evaluate feedback from proprioception, from others, and from the performance of complex motor (movement) activities to improve performance in aquatic, rhythms/dance, individual activities, and dual activities.

1.12 Demonstrate independent learning of movement skills

3.1 Accept personal responsibility to create and maintain a physically and emotionally safe and nonthreatening environment for physical activity

3.10 Identify and utilize the potential strengths of each individual in physical activities

CCCSS ELD Standards:

ELD Standard (Speaking/Listening)

SL.9-10.1, 6; L.9-10.3, 6 Exchanging information and ideas with others through oral collaborative discussions on a range of social and academic topics.

SL.9-10.1, 3, 6; L.9-10.1, 3, 6 Listening actively to spoken English in a range of social and academic contexts

ELD Standard (reading/writing)

W.9-10.1: WHST.9-10.1:SL.9-10.1, 4, 6; L.9-10.3, 6 Interacting with others in written English in various communicative forms

W.9-10.4-5; WHST.9-10.4-5; SL. 9-10.4, 6; L.9-10.1, 3, 5-6 Selecting and applying varied and precise vocabulary and other language resources to effectively convey ideas
W.9-10.4-5; WHST.9-10.4-5; SL.9-10.6: L.9-10.1, 3, 6 Adapting language choices to various contexts (based on task, purpose, audience, and text type)

Student Learning Objectives:

Psychomotor Objectives:

Students will be able to perform a tennis forehand using the appropriate psychomotor cues during drills and activities.

Cognitive Objectives:

Students will be able to identify and recall the essential psychomotor cues of the forehand groundstroke during drills and closure.

Students will be able to think critically about the components of the forehand during the closure activity.

Affective Objectives:

Students will be able to provide positive feedback during modified gameplay and peer assessment periods.

Students will be able to engage in and maintain a positive, safe, and nonthreatening environment during class activities.

Making Content Accessible:

- Throughout the lesson I drew on students' prior knowledge and experience in a variety of ways. At the beginning of the lesson I performed a "KWL" chart, which assesses what students know, want to know, and at the end of the lesson we will review what they have learned. This is used to activate prior knowledge and interest. After the "KWL" chart, I began the lesson with an anticipatory set or set induction that built on students' prior knowledge in order to get students familiar with a tennis racquet as this is the first lesson of our tennis unit. I also used visual aids such as poster examples to help students understand how to grip the racquet with the eastern grip. Teacher demonstrations, peer demonstrations, and modeling was also used throughout the lesson as a means for students to observe the skill and gain an understanding of the material. Academic vocabulary from other sports was also transferrable from other sports. Total Physical Response is a GLAD strategy and a SADIE strategy that aims to pair physical movements with academic vocabulary and academic language to help students who struggle with academic language make meanings. This was used in this lesson and throughout the learning segment.
- Throughout this lesson I used Gardner's Theory of Multiple Intelligences to inform my instructional design. In Gardner's Theory of Multiple intelligences, "intelligences" represent an individual's primary sensory modality. I tried meet students' intelligences in many ways throughout the lesson. There were modalities in the lesson that would aid students' in many intelligences. Lecture during teacher demonstration, think-pair-shares, and reading text off of a white board were incorporated in this lesson for verbal-linguistic intelligent students. Written assessments were also placed in the lesson during closure for these students. Visual-spatial intelligent students will benefit from teacher,

peer demonstrations, and total physical response. During the peer assessment, critical thinking about a peer's performance is involved and this deeper thinking addresses logical-mathematical intelligent students. Body-kinesthetic intelligent students learn by performing bodily motions so these students will benefit from Total Physical Response, practice, and modeling. Interpersonal students work well with others through cooperation and think-pair-shares and group activities really help these students comprehend the content. Peer-assessments are great for interpersonal students. Intrapersonal students learn well through self-reflection. During one of the learning task students have the opportunity to work alone and this is great for intrapersonal students. Bandura's observational theory was also incorporated into the lesson as teacher demonstrations and student demonstrations were performed as a means of providing students learning opportunities to observe others perform the forehand.

- Students will be forced to compare and contrast performance of the cues and whole skill during think-pair-shares, peer observations, and the peer assessment. Students will critically think throughout the teacher demonstration by the teacher posing questions about why students believe the cues are important to the skill. Also, the closure assignment will include open ended questions with a lot of "why" questions posed to students so that students must think critically and elaborate on their answers. This forces students to go beyond surface level understandings. The closure assignment is also a way for students to summarize what they have learned as they must incorporate cues into their responses.

Prerequisites/Prior learning

1. Ready position, ready stance, athletic stance (used in almost all sports)
2. Dominant hand – the hand that is preferred when performing fine and gross motor tasks
3. Base knuckle – the knuckle located at the base of the index finger
4. Index finger – pointer finger

Academic language demands:

- The students at Richmond High School demonstrate many language needs. According to the 2015-2016 School Accountability Report Card 39% of students are meeting or exceeding the state standards in English Language Arts. This is behind the state average of 48% of students meeting or exceeding the state standards in English Language Arts. 38.1% of the student body consists of English Learners, which presents a challenge for teaching and learning. Although many students' test scores present them as non-proficient in the language, many of the students are proficient in conversational and spoken English. Their ability to communicate in conversational English is a huge language strength. Syntax, grammar, language structure, and other writing conventions are a challenge for students. The largest group of ELs speaks Spanish. Most of these students are newcomer students. The majority of these students come from Mexico and Central American Countries. A small percentage of the newcomer students come from South East Asian countries. One language strength is that a large population of the students are bilingual and are very helpful in scaffolding academic content and material.
- The majority of my class is proficient enough in English to comprehend the academic language for this lesson. These students could perform the following lesson without the

text representation on a white board and without Total Physical Response. These students could probably perform all of the learning tasks simply by observing the teacher demonstrate the skill, but I believe all of the mediums incorporated into the lesson truly aid in the understanding of the material. Students who are not proficient in English are fully capable of understanding the academic vocabulary by the end of the lesson with all of the scaffolds that are incorporated in the lesson.

- I do have 9 students classified as English Language Learners (all of these students are classified as beginner or early intermediate in all mediums, reading, writing, and speaking). I also have 3 students with IEPs and 1 student on a 504 plan. These students do not necessarily struggle with the academic language in physical education, but they definitely benefit from many of the strategies that I perform for my English Language Learners (as do most students). These students sometimes require additional time for their closure assignments and some additional feedback, demonstration, and modeling during activity.
- A language strength in my class is that the majority of the population is Hispanic and bilingual. This is a huge benefit as these bilingual students are great in aiding with the English Language Learners and help assure that the English learners are understanding the content and lesson objectives.
- The students are not familiar with a lot of the vocabulary that will be covered in the lesson. There is some prior learning that has occurred, but there is a lot of academic language in tennis and because of this I have included many mediums in order to assure student learning. The essential vocabulary is listed below.
- There will be many academic language supports in place such as Guided Language Acquisition Strategies (GLAD) and Specially Designed Academic Instruction in English (SADIE) strategies. Visuals, text representation, opportunities for students to produce the words in written and oral formats, modeling, and demonstrations are included throughout the lesson.
- In this lesson, problematic academic language and vocabulary is represented by the cues of the forehand and the eastern grip. I do not believe this is overly challenging for my students, but I do believe that the lesson is appropriately challenging. The most problematic part is that a lot of academic language is going to be thrown at students in this first lesson, but it will be reviewed and repeated over the course of the next two lessons. This provides plenty of time for students to learn the material.

List essential vocabulary.

- Tennis Racquet – Long handed implement used to strike a tennis ball
- Grip/handle – The area of the racket used to hold or grip the racket
- Groundstroke – a stroke used to strike the ball after it has bounced on the ground
- Forehand – a groundstroke that is played from around the baseline when the ball has bounced once using your dominant hand
- Bevel – a square edge on an object
- Eastern Grip – a grip used by most novice tennis players where the base knuckle of index finger belongs on the third bevel
- Watch the ball – looking at the ball as it makes contact with your racquet
- Swing low to high – swinging from underneath the ball to over the ball

- Stepping in opposition/weight transfer – stepping with the opposite foot of the primarily used hand (in the forehand the dominant hand is the primary hand so for a righty they would step with their left foot first to transfer weight in the direction of their target)
- Perpendicular to target – turning your side to target
- Follow through – continuing one’s movement after the ball has been struck (in this case up towards the opposite shoulder)

Assessment:

The assessments that I have selected for this lesson are all formative. During the first week of the tennis unit I am using low stakes formative assessments to focus on student learning of the content. Students will be observed during learning tasks and during instruction. Students will be asked questions and assessed on a checklist style rubric that revolves around their performance of the forehand. This checklist represents the assessment tied to the psychomotor objective of the day. The closure assignment provides prompts where students must use the academic vocabulary in order to display their learning and comprehension of the cognitive objectives. The affective objectives are embedded into the lesson (i.e. pair shares, partner work, positive prompts within the peer assessment).

As I circulate around the tennis facility I will provide timely individual, corrective, and positive feedback to students to assure learning of the material. Feedback will be given during both practice drills and during Total Physical Response. The cue checklist is very helpful as it helps identify cues that the students are not performing. One cue (such as watching the ball) could determine whether the performance of the skill is good or bad. I will also grade and provide feedback on the written closure assignment by the following day. Any misunderstandings that are reoccurring will be addressed as feedback to the whole class. Students will receive feedback in writing and orally as we get into rallying in the next lessons.

I will know that my students have met the objectives through observation, embedded assessment, and their exit ticket responses.

- **Daily Learning Objective Rubric**

The daily learning objective rubric will consist of the psychomotor cues provided during demonstration. Students will earn points based on performing the cues provided during instruction. There are 6 cues that will be on the rubric including: (1)Grip, (2)watch the ball, (3)perpendicular to target, (4)transfer weight by stepping in opposition, (5)swing from low to high, and (6)follow through. The Daily Learning Objective Rubric provides the best opportunity to provide individualized feedback to students who may need assistance. The teacher will be assessing student learning and as the teacher is monitoring. The teacher should also give feedback to help the students comprehend the cues and movements, as well as earn the points for the day. This also provides students with opportunities to ask questions and get positive and congruent feedback for the forehand groundstroke from the teacher. Students will have a number of opportunities provided to them to learn what is being assessed. Students will have the opportunity to learn through teacher demonstration and modeling, teacher performing Total Physical Response with the students, during the drop, hit” drill and during the “wall ball” drill. The teacher will assess the students’ ability to perform cues that are on the rubric. This is an informal assessment that is content and performance focused.

Peer Assessment Closure Assignment

The peer assessment exit ticket will be provided to students during closure to give students an opportunity to access both productive and receptive skills. Students will have had to have been receptive of the teacher modeling of the academic language and have been attentive by listening to the instruction given by the teacher. Students will have had the opportunity to produce a performance of the forehand during drills, provide verbal feedback to a peer during drills, and provide written feedback at the end of class for a peer. The written feedback will also represent some depth of understanding of the forehand groundstroke. The prompts included are:

1. What are some cues that your partner for the activities performed well?
2. What can they improve on?
3. Why do you think they performed specific cues well?
4. What can you learn from observing their performance of the skill?

These question should elicit deeper level thinking, determine whether they understand the material, and display an understanding of the cognitive and affective objectives (as the questions set up students to answer positively about their partners).

Instructional Sequence:

5 Min.	Dress & Attendance
5 Min.	KWL Chart (PACT Rubrics 1 and 2) Teacher will present a KWL chart to gain an understanding of what students know (background knowledge/context for learning and what they want to know about tennis. At the end of class the teacher will bring the lesson full-circle and find out what they learned from the lesson.
7 Min.	Set Induction for Racket Implementation (PACT Rubric 1) - Teacher will pose a question to connect or scaffold student learning by building on their prior knowledge: <i>How many of you have ever cooked pancakes before? Or have "cooked" as in the "cooking" hip hop dance?</i> - Teacher will provide instruction: "I want everyone to pretend that our rackets are long handled pans and that we are flipping pancakes in the air from our pans! Now everyone show me you pancake flipping skills or dance moves (15-30 Seconds)!" - As the students are performing this the teacher (and potentially a teacher assistant) will provide one ball to everyone in the class. - The teacher will have everyone freeze for brief instruction. "Now I want everyone to replace those pancakes with this tennis ball and bounce this tennis ball in the air in self-space." (1 Min.) - Teacher will then provide further instruction as they are bouncing the balls in self-space: "Now I want everyone to continue to bounce their ball on their racket while moving! Watch out for class mates!" - After performing "ups" we will perform "downs" where we dribble the ball using the racket. After we perform that we will then perform downs while moving. - This activity is meant to draw on students' prior knowledge to help students get comfortable with holding a racquet and eventually using the racquet in a tennis match an individual or dual setting.

8 Min.	Progression of learning tasks Racket Introduction •Students will be provided with tennis rackets •Teacher will briefly and concisely review the anatomy of the racket in 1-2 minutes (grip, frame, head of racket, and sweet spot) using scaffolding techniques such as visual scaffolding and Total Physical Response (TPR) •Teacher will write bevel numbers with a sharpie on the grips of all of the rackets Teacher Demonstration and Practice • Teacher will demonstrate the psychomotor cues of the forehand groundstroke and the proper grip: ○ Teacher will demonstrate the appropriate grip by modeling the grip and using a poster to help students visualize how they need to grip the racquet. All tennis rackets have handles that are the shape of a hexagon. By placing an over grip on each tennis racket prior to the lesson and writing with sharpie where their index fingers should be positioned when gripping the racket will make this process much easier for students to understand. The numbers written in sharpie also provides a great visual. This will be paired with a poster board breakdown of the eastern forehand grip. The eastern grip is what most students will naturally do and is simpler to teach as left handed students and right handed students grab the racket in the same spot. ○ Then the teacher will write the cues on a portable whiteboard while verbally identifying the cues while demonstrating/modeling the movements and cues of the forehand groundstroke for the lesson: 1. Watch the ball to make good contact 2. Perpendicular to target (Side to target) with knees slightly bent 3. Swing from low to high 4. Transfer weight by stepping in opposition 5. Make contact with the ball to the side and out in front of you and follow through across your body and up towards the opposite shoulder. ○ Teacher will then ask the students to perform/mirror the forehand in self-space at least two arms width apart from their neighbor as the teacher verbally says the steps and demonstrates the steps for the students to mirror. (Verbal and Visual Scaffolding and Total Physical Response that benefits English Language Learners and All Students) ○ The portable white board will allow for academic language to be seen by the students and for written language to be incorporated in this physical education lesson. ○ The teacher will model each cue multiple times as he says the cues. ○ Teacher will check for understanding throughout the lesson and provide feedback. ○ These are all methods that will help support students who often struggle with the content. ○ Teacher will mention student safety concerns for the tennis unit: Do not swing a racket when someone is nearby, do not get close to someone who is swinging at a ball, and do not continue to play if a loose ball is near someone's feet as this is a tripping hazards.
----------------------	---

10 Min.	“Drop, Hit” Drill • This drill will be performed on the tennis courts. • Students will partner up and perform a drill where they will be standing slightly out in front of their partner and off to the side (on the forehand side). • One student will drop the ball as the other performs the cues of the forehand. • The student performing the forehand will say “drop” when he wants his or her partner to drop the ball and “hit” as he or she makes contact with the ball. This assures that the student is watching the ball as they make contact with the ball. • Teacher will model the drill with a student volunteer. • After 20 balls students will switch roles. • Modifications: Students may stand as far back or as close to the net as possible so that students of all different abilities are challenged appropriately. • Modifications: A variety of balls will be available: there are different tennis balls (i.e. green dot balls bounce lower and slower than a regular ball, foam balls are the easiest balls to hit that are made) • After everyone has performed the forehand drill I will allow 2 minutes for a think-pair-share to allow peers to share ideas with each other • This provides students the opportunity to exchange information and ideas regarding the skill by referring to the cues.
12 Min.	Wall Ball Drill • Students will be required to grab self-space near a wall outside of the gym. • Students will then practice the forehand groundstroke using the cues provided by the teacher. • This is an opportunity for students to demonstrate independent learning of the forehand. I • Modifications: Students can start as close to the wall as they wish and use foam balls or low compression balls • Modifications: Students who struggle with a full size racket can use a racket with a youth sized grip The teacher will walk around monitoring student progress with a Daily Learning Objective Rubric (psychomotor objective check and an embedded form of assessment) while providing positive and corrective feedback to students who need it. The rubric will include the following cues: Grip, watch the ball, perpendicular to target, transfer weight by stepping in opposition, swing from low to high, and follow through.
3 Min.	KWL Chart • Now back to our KWL chart! The teacher will now complete the last column (what have we learned?) with the students. • Students should now have knowledge of the following: • Eastern Grip • What a groundstroke is. • The cues of the forehand: Watch the ball, perpendicular to target, transfer weight by stepping in opposition, swing from low to high, and follow through.

5 Min	Closure: Peer Assessment Closure Assignment - On a worksheet students will answer the following questions: - What are some cues that your partner for the activities performed well? - What forehead cues could they improve on? - Why do you think they performed specific cues well? - What can you learn from observing their performance of the skill? These questions display the students' abilities to be receptive throughout the lesson as well as give them an opportunity to produce the academic language in a written format while displaying some depth of understanding of the skill. - After completing the exit ticket, students will exchange their card with their partner briefly so that students can learn to analyze and evaluate feedback to improve performance. Teacher can model the use of academic language and provide an enlarged copy of sample work on the white board so that students know what is expected of them. Students should be able to summarize learning by answering the prompts.
5 Min.	Dress
	Reflection: Monitoring student progress and reflecting on learning (PACT Rubrics 7,8,9,10) The instructional strategies in the lesson reflected attention to my context for learning well. All students were able to either display knowledge through their performance of the skill or on their closure assignment. The Total Physical Response (TPR) and pairing of ELs with bilingual students worked like a charm. Demonstrating the cues was the most helpful for students with learning needs. I believe that applying Gardner's Theory of Multiple Intelligences allowed me to focus on using so many scaffolds to address different intelligences that the majority of my class understood the material with ease. Throughout the lesson, the majority of students did not need much differentiation (I credit Gardner's Theory), but a few students did. Some of my EL students required additional modeling and demonstration during drills, activities and learning tasks. I credit Bandura's Observational Theory for the basis on which I decided to incorporate physical modeling as a means of feedback. A few of the EL students either needed extra time on the closure assignment or help from a bilingual classmate. During the learning tasks, students were required to either work in pairs or individually and these tasks gave me a lot of opportunity to provide feedback and scaffold for these students. Also, there were so many bilingual students in my class that all EL students were able to gain an understanding of the material regardless of how proficient they are in English. I provided a lot of timely individualized feedback to all of my students based on the cues. I was positive and corrective with my feedback to students. I acknowledged any cues that students performed well as I monitored the learning tasks. I also pointed cues out that they were missing or performing incorrectly. The checklist was a great indicator of student progress and learning. Any skill that a student could not perform was simply not checked off on the checklist. As long as the majority of the class was able to score well on the checklist rubric, the class was able to move forward. The majority of this class was able to perform the psychomotor tasks. A

	few individuals struggled with the closure assignment, but not many. The evidence of student work displayed that students who were attentive and tried were ready to move on. Some students may need to revisit the skill and attain additional scaffolds. More visuals and additional modeling of the cues should get them over the learning curve. ELs were able to use the academic vocabulary that was on the portable white board during the peer assessment, but additional modeling and sample work could do wonders for some of the struggling students. These were included in subsequent lessons. Adjustments could have been made regarding the anticipatory set. I performed an introductory activity and a KWL chart and my goal is to get students more time to practice the skill so I believe I should cut one of these out for time purposes in the future. I could possibly begin the next class with the “what did you Learn” section of the KWL chart to scaffold this lesson. I could also give out the worksheets with feedback at the beginning of class and review them with students as a whole and individually as I did not plan this originally. I do not believe this is a lesson that needs to be retaught, but it will be helpful to scaffold from this lesson throughout the learning segment. The next lesson, the backhand, actually has the same cues and many of the aspects of this lesson will be repeated throughout the next lesson.
--	--

Daily Learning Objective Checklist: Forehand Rubric	Easter Grip	Watch the ball	Perpendicular to target	Step in Opposition/ Transfer weight	Swing low to high	Follow Through	Total Score
Moreida, Christopher	x	X	x	x	x	x	6
Reyes, Jose	x	X	x	x	x		5
Torres, Brisia	x	X	x	x	x	x	6

Peer Assessment: Forehand Groundstroke	
5	Student can recall the cues and provides feedback utilizing multiple cues and academic vocabulary for the lesson. Student provides positive feedback for their partner. Student provides constructive feedback for their partner referencing the cues and academic vocabulary for the lesson. Student displays that they were able to gather knowledge by observing their partner perform the forehand. Student displays a deep understanding of the material.
4	Student can recall the cues and provides feedback using some academic vocabulary. Student provides positive feedback for their partner. Student provides constructive feedback using the cues. Student could have incorporated more academic vocabulary in their responses to the prompts to display a deeper understanding of the skill.
3	Student displays limited knowledge of the cues for the forehand. Student provides positive feedback for a partner. Constructive feedback references cues and academic vocabulary very little. Student displays some knowledge of the forehand, but not a deep understanding.
2	Student does not use academic vocabulary in his or her response, but is able to show some to provide positive feedback for their partner. Student is able to display some feedback, but feedback could use more guidance. Feedback needs to reference the cues more. Shows very limited understanding of the material.
1	Student provides little to no feedback for their partner. Student responds to the prompts, but not by referencing the cues and academic vocabulary. Student may or may have not provided positive feedback. Student is attempting to the answer the prompts, but does not show an understanding of the skill.

Lesson 1 Closure Assignment: The Forehand Peer Assessment

Name _____ Per. _____ Date _____

Directions: Respond to the prompts using the academic vocabulary and academic language taught in today's lesson.

1. Identify at least 3 cues of the forehand groundstroke:
2. What are some forehand cues that your partner performed well during the "drop, hit" partner activity?
3. What forehand cues could they improve on?
4. Why do you think they performed specific cues well?
5. What can you learn from observing their performance of the skill?

Lesson 2: Learning Segment Central Focus or “Big Idea”:

The central focus of this learning segment is to get students to be able to play in a competitive tennis rally. The focus of this specific lesson is the backhand groundstroke, specifically the psychomotor aspects of the backhand groundstroke and the cognitive knowledge of how to perform the backhand groundstroke. Students will also gain an understanding of why the cues are essential to the backhand.

Grade: 9**Content Area: Physical Education/Tennis****TEACHER: Mr. Jaymot****Students: 47****Time Allotted: 60 Minutes****Classroom organization:**

1. Roll call numbers
2. Gymnasium
3. Tennis Courts
4. In self-space in-between the basketball gym and the tennis courts (large blacktop space)

Resources and materials: 50 tennis racquets, 200 tennis balls, 20 foam balls, 20 low compression balls, dry-erase marker Portable white board, tennis backboard or a long wall, daily learning objective rubric spreadsheet, self-assessment assignment worksheets, 50 pencils, ball hoppers or buckets, projector, screen or blank wall

California Content Standard(s):

1.2 Demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.

1.3 Identify, explain, and apply the skill-related components of balance, reaction time, agility, coordination, explosive power, and speed that enhance performance levels in aquatic, rhythms/dance, and individual and dual activities.

1.12 Demonstrate independent learning of movement skills.

3.1 Accept personal responsibility to create and maintain a physically and emotionally safe and nonthreatening environment for physical activity

CCCSS ELD Standards:

ELD Standard (Speaking/Listening)

SL.9-10.1, 6; L.9-10.3, 6 Exchanging information and ideas with others through oral collaborative discussions on a range of social and academic topics.

SL.9-10.1, 3, 6; L.9-10.1, 3, 6 Listening actively to spoken English in a range of social and academic contexts

ELD Standard (reading/writing)

W.9-10.1: WHST.9-10.1:SL.9-10.1, 4, 6; L.9-10.3, 6 Interacting with others in written English in various communicative forms

W.9-10.4-5: WHST.9-10.4-5; SL. 9-10.4, 6; L.9-10.1, 3, 5-6 Selecting and applying varied and precise vocabulary and other language resources to effectively convey ideas

W.9-10.4-5; WHST.9-10.4-5; SL.9-10.6: L.9-10.1, 3, 6 Adapting language choices to various contexts (based on task, purpose, audience, and text type)

Student Learning Objectives:

Psychomotor Objectives:

Students will be able to perform a tennis backhand using the appropriate psychomotor cues during drills.

Cognitive Objectives:

Students will be able to identify the essential psychomotor cues of the backhand groundstroke during drills and closure.

Students will be able to think critically about the components of the backhand during activity and the self-assessment.

Affective Objectives:

Students will be able to provide positive feedback during modified gameplay and peer assessment periods.

Students will be able to engage in and maintain a positive, safe, and nonthreatening environment during class activities.

Making Content Accessible:

- This lesson is almost identical in structure to the first lesson as far as having a similar instructional sequence. This allows me to build on their experiences from the day before. Two of the learning tasks (drills) are the same as the day before and the closure includes a similar assignment (a self-assessment rather than a peer assessment). This allows me to scaffold the previous lesson. Also, the cues are identical with the exception of how to grip the racquet. This

represents another way in which I can scaffold the previous lesson as the cues repeat themselves.

- The same scaffolds as in lesson 1 were used for students who struggle with academic vocabulary and academic language. These scaffolds included physical modeling (demonstration), oral instruction, text representation of the vocabulary on a white board, total physical response, and individualized feedback. A video is also shown in this lesson to help students understand the academic language.
- I also perform an anticipatory set by showing an instructional tennis backhand youtube video to give students someone else to observe other than myself. I will also demonstrate and model the backhand. We will perform Total Physical Response, just like we did the day before.
- In this lesson I also incorporated Garner's theory of multiple intelligences in the same way that I did in the previous lesson. I incorporated many teaching modalities in order to reach all of the different intelligences. Additional to this theory, Bandura's Observational Learning Theory heavily influenced this lesson. Bandura's Theory revolves around the idea that behavior can be learned through the observation of others. So in this lesson I included a youtube tutorial video that students could observe as an anticipatory set. I also demonstrated the skill and had student volunteers demonstrate the skills.
- Students will receive a rubric checklists (almost identical to the one used in the first lesson). Students will have to assess their selves based on the rubric and critically think about why they struggle with certain cues with the backhand. This will also display a summary of what they have learned. Students will have to elaborate on their thoughts regarding the backhand.

Prerequisites/Prior learning

1. Ready position, ready stance, athletic stance (used in almost all sports)
2. Dominant hand – the hand that is preferred when performing fine and gross motor tasks
3. Base knuckle – the knuckle located at the base of the index finger
4. Index finger – pointer finger
5. Groundstroke - a stroke used to strike the ball after it has bounced on the ground
6. Watch the ball – watch the ball as it makes contact with your racquet
7. Swing low to high – swinging from underneath the ball to over the ball
8. Stepping in opposition/weight transfer – stepping with the opposite foot of the primarily used hand (in the forehand the dominant hand is the primary hand so for a righty they would step with their left foot first to transfer weight in the direction of their target)
9. Perpendicular to target – turning your side to target

10. Follow through – continuing one’s movement after the ball has been struck (in this case up towards the opposite shoulder)

11. Bevels on a racquet

12. Non-dominant hand – the hand that is least preferred when performing fine and gross motor tasks

Academic Language Demands:

- As covered in Task 1 Context for Learning, the majority of my class is proficient in English and are fully capable of comprehending academic language. These students could perform the lesson with minimal instruction as it is nearly identical to the previous lesson. Minimal instruction and modeling would be sufficient for these students. There is also less academic vocabulary in this lesson than the first lesson. The Continental grip and two-handed backhand are the only new terms in this lesson. These students could probably perform all of the learning tasks simply by observing the teacher demonstrate the skill, but I believe that all of the modalities incorporated into the lesson will help with comprehension.
- This lesson should scaffold cues for my 9 ELs, 3 IEP students and my one 504 student. The similarity will help with student understanding as the cues are repeated for two different skills. This lesson is a bit easier as the language demands are lighter since so much can be scaffolded from the first lesson. The two-handed backhand and continental grip are the only two new pieces of academic vocabulary that are present in the lesson.
- Once again, bilingual students are a huge strength in my class. These students are very helpful in bridging knowledge for ELs.
- Another language strength is that physical activity is widely popular (particularly soccer) among my students. These students learn conversational words regarding sports very quickly. Many of the ELs are able to pick up words very quickly when they are paired with physical movement.
- There will be many academic language supports in place such as Guided Language Acquisition Strategies (GLAD) and Specially Designed Academic Instruction in English (SADIE) strategies. Visuals, text representation, opportunities for students to produce the words in written and oral formats, modeling, and demonstrations are included throughout the lesson.
- Vocabulary that may be problematic in this lesson is the continental grip. Similar to in the first lesson, I created a poster visual on how to hold the racquet for this grip. Visuals seem to help tremendously additional to modeling. Any vocabulary that students struggled with in lesson one can be reviewed as well as the only thing that changed was the grip and how to hold the racquet. The cues remained the same.

List essential vocabulary.

- Two-handed backhand – a groundstroke that is often used around the baseline after the ball has bounced once. This stroke is used when the ball is traveling towards the side associated with your non-dominant hand
- Continental Grip – also known as the hammer or axe grip, this is the grip used by the dominant hand when performing a two-handed back hand and will also be used for the volley in future tennis learning segments

Assessment:

The assessments in this lesson are all formative. Similar to the first lesson, students will be observed and assessed on a rubric checklist that consists of the cues for the backhand and the two-handed backhand grip. This is directly related to the psychomotor objective. The self-assessment based on the rubric and a few prompts at the end of the lesson are reflective of the cognitive objectives regarding students being able to identify the cues of the backhand. The affective objective is incorporated with our class rules and routines and is an expectation of the class. As long as students maintain a safe environment, they receive points for the day for meeting this objective.

As I circulate around the tennis facility I will be looking for competency in the backhand. I will know that students have accomplished the objectives if they are able to perform the skill utilizing the cues provided in class and if they are able to use the academic vocabulary in their self-assessment closure assignment. If they are able to do this they are displaying competency of the lesson content. If not, feedback can be given within the lesson. Individualized positive and corrective feedback will be given throughout instruction and learning tasks (drills) as I circulate the facility. This feedback will be timely and should help students perform well on the assessments. Students are being observed and assessed on a rubric and this will help me pinpoint corrective feedback opportunities in a timely fashion. I will also provide feedback and grades on the closure assignment by the next lesson. Any widely spread misunderstandings will be covered with the whole class. Other misunderstandings will be addressed individually in writing and orally if I have time.

- Daily Learning Objective Rubric

The daily learning objective rubric will consist of the psychomotor cues provided during demonstration. Students will earn points based on performing the cues provided during instruction. There are 5 cues and the grip that will be on the rubric: (1) Grip, (2) Watch the ball and recognize to perform a backhand, (3) Perpendicular to target with knees slightly bent, (4), Swing from low to high, (5) Transfer weight and step in opposition, (6) Make contact with the ball to the side and slightly out in front of you and follow through up towards your opposite shoulder. This is an informal assessment that is content and performance focused.

- Self-assessment Closure Assignment

The Self-assessment Exit Ticket will provide an assessment for students that accesses productive modalities (written). This will also display their abilities to be receptive throughout a lesson as they will

have to write about what was learned in class. A rubric will be included on how students will be graded. Students will be expected to display an understanding of the skill and cues while utilizing academic vocabulary and academic language if they wish to earn the highest score on the rubric (4). If students display knowledge of the skill, but are limited on the use of academic vocabulary the student will obtain a 3. If a student displays an understanding of the movement, but does not incorporate academic language in the responses to the prompts, the student will receive a 2. If a student is able to show some understanding of the skill while using little to no academic vocabulary the student will receive a 1. A 0 displays no understanding of the skill and no academic vocabulary in student work.

Instructional Sequence:

5 Min.	Dress & Attendance
5 Min.	Anticipatory/Introductory set The teacher will present a two-handed backhand tutorial video from intosport.com directly after roll call. This video will provide a visual for representation of the two-handed backhand students with an auditory voice over to aid in understanding. This video will be used to build knowledge and will scaffold learning as the teacher begins to break down the cues and model the cues for students. The video URL can be found at: https://www.youtube.com/watch?v=c7tDVv1cBeM This anticipatory set is shown to provide students with an idea of what the two-handed backhand should look like. There is very little tennis knowledge among the student population and the video should help spark interest and help students reach the PEC standard and learning objective. This video is also a great tool in helping students understand the material who typically struggle with the content.
10 Min.	Teacher Demonstration and Practice • The teacher will demonstrate/model the psychomotor cues of the backhand groundstroke and the proper grip. The teacher will also write the cues (academic language) on a portable white board. ○ Teacher will demonstrate the appropriate grip for both right and left handed students. The teacher shall use the analogy that students are trying to “use the frame as a hammer.” To do this students must use imagery to imagine that they are hitting a nail with the frame of the racket. The frame of the racket should appear to be perpendicular to the ground. After this grip is obtained students must use their non-dominant hand to grab the portion of the grip that is above their dominant hand.

	- Two-handed Backhand Grip – Hold the racket with the frame pointing towards the ground with your dominant hand. Then place your non-dominant hand above your dominant hand on the grip as if you were performing a forehand with your non-dominant hand. - Watch the ball and recognize the ball is going to your backhand - Perpendicular to target with knees slightly bent - Transfer Weight by stepping in opposition - Swing from low to high - Make contact with the ball to the side and slightly out in front of you and follow through across your body and over the opposite shoulder. - The grip is the main difference, but the cues are relatively the same as the forehand. Teacher should scaffold upon prior learning from lesson 1 of the learning segment as the cues are the same other than the gripping of the racquet. - Teacher will then ask the students to perform/mirror the backhand in self-space at least two arms width apart from their neighbor as the teacher verbally says the cues and demonstrates the steps for the students to mirror. This represents total physical response (TPR). This is one of the opportunities for students to learn what is going to be assessed.
13 Min.	“Drop, Hit” Drill - This drill will be performed on the tennis courts. - Students will partner up and perform a drill where they will be standing slightly out in front of their partner and off to the side (on the forehand side). - One student will drop the ball as the other performs the cues of the forehand. - The student performing the forehand will say “drop” when he wants his or her partner to drop the ball and “hit” as he or she makes contact with the ball. This assures that the student is watching the ball as they make contact with the ball. - Teacher will model the drill with a student volunteer. - After 20 balls students will switch roles. - Modifications: Students may stand as far back or as close to the net as possible so that students of all different abilities are challenged appropriately.

	• Modifications: A variety of balls will be available: there are different tennis balls (i.e. green dot balls bounce lower and slower than a regular ball, foam balls are the easiest balls to hit that are made) • After everyone has performed the forehand drill I will allow 2 minutes for a think-pair-share to allow peers to share ideas with each other This provides students the opportunity to exchange information and ideas regarding the skill by referring to the cues. The teacher will walk around monitoring student progress with a Daily Learning Objective Rubric (psychomotor objective check and an embedded form of assessment) while providing positive and corrective feedback to students who need it. The rubric will include the following cues: Grip, Watch the ball, perpendicular to target, transfer weight by stepping in opposition, swing from low to high, and follow through. This will be one opportunity provided for students to learn what is assessed. This is also an opportunity for students to produce a performance of the backhand while being assessed (embedded assessment).
15 Min.	Backhand Wall Ball • Students will be required to grab self-space near a wall outside of the gym. • Students will then practice the backhand groundstroke using the cues provided by the teacher. • Modifications: Students can start as close to the wall as they wish and use foam balls or low compression balls • Modifications: Students who struggle with a full size racket can use a racket with a youth sized grip The teacher will walk around monitoring student progress with a Daily Learning Objective Rubric (psychomotor objective check and an embedded form of assessment) while providing positive and corrective feedback to students who need it. The rubric will include the following cues: Grip, Watch the ball, perpendicular to target, transfer weight by stepping in opposition, swing from low to high, and follow through. This will be one opportunity provided for students to learn what is assessed. This is also an opportunity for students to produce a performance of the backhand while being assessed (embedded assessment).

7 Min.	Closure: Self-Assessment Assignment • Provide students with a blank copy of the Backhand Rubric that they were assessed with during the drills. Also provide them with a concise rubric for the self-assessment exit ticket. • Have them score themselves. • Have the students answer an open-ended question regarding why they believe they earned that score and what they can do to perform the skill better? • Have students explain what was the most difficult cue and why? These questions will allow students to show some depth of understanding of the material that was learned in class as well as display independent learning of movement skills. This assessment also allows them to produce written work using the academic language that was incorporated into the lesson. This exit ticket should provide students with an opportunity to show some depth of understanding of the backhand groundstroke. A rubric will be included on how students will be graded. Students will be expected to display an understanding of the skill and cues while utilizing academic vocabulary and academic language if they wish to earn the highest score on the rubric (4). If students display knowledge of the skill, but are limited on the use of academic vocabulary the student will obtain a 3. If a student displays an understanding of the movement, but does not incorporate academic language in the responses to the prompts, the student will receive a 2. If a student is able to show some understanding of the skill while using little to no academic vocabulary the student will receive a 1. A 0 displays no understanding of the skill and no academic vocabulary in student work. Provide a sample of student work as an example for the students to see how students should be using the academic language.
	Reflection: Monitoring student progress and reflecting on learning (PACT rubrics 7, 8, 9, 10) I found that providing students with an instructional video at the beginning of class was extremely helpful. Students being able to observe another individual performing the backhand and teaching the backhand with similar cues helped with clarity of the skill. Displaying videos stemmed from Bandura's Observation Learning Theory. Modeling was huge for students, especially ELs and other students with special needs. Having a variety of people display the skill really helped (myself, video instructor, and student volunteers). This was also supported by Bandura's Observational Learning Theory. The white board display remained in the lesson and helped by allowing students to see the academic vocabulary as text. This came in handy as students referred to this when answering

	the prompts on the self-assessment assignment. This was a very multimodal lesson just like the first lesson as I still presented information through multiple mediums. Gardner was one of the theorists that supported the framework of my lesson design as his theories point out that there are many intelligences or primary senses in which an individual learns best. As I reflect on the lesson, I noticed that I used a lot of constructive/corrective feedback and I should use more positive feedback in the future. The backhand is one of the most difficult tennis skills and I believe that I focused too much on correcting students and not enough time providing positive and encouraging feedback. Unlike the first lesson, I made the adjustment of including an example of student work of the self-assessment. This really did wonders for the ELs and all students who struggle using academic language. The evidence in this lesson was represented by an observation checklist and a self-assessment. I gauged how well they performed the psychomotor skills through observation. The self-assessment was huge in displaying how students were feeling about the backhand groundstroke. I took both my observations and the self-assessment into consideration prior to deciding whether the lesson should be revisited with adjustments or if I should move forward. Students displayed sufficient competency and a positive feeling about the skill and I was able to move forward. The next lesson was designed to scaffold the forehand and backhand, so for the students who did not feel confident about the skill, they will have another opportunity to catch up on the skill.
--	---

Daily Learning Objective Checklist: Two handed Backhand Rubric	Continental Grip/ Two handed	Watch the ball	Perpendicular to target	Step in Opposition/ Transfer weight	Swing low to high	Follow Through	Total Score
Moreida, Christopher	x	x	x	x	x	x	6

Reyes, Jose	x	x	x	x	x	x	6
Torres, Brisia	x	x	x	x	x	x	6

Self-Assessment: Backhand Groundstroke	
5	Student scores his or herself based on the rubric above. Student provides self-feedback utilizing multiple cues and academic vocabulary for the lesson. Student provides constructive feedback for his or herself referencing the cues and academic vocabulary for the lesson. Student displays a deep understanding of the material.
4	Student scores his or herself based on the rubric above. Student provides his or herself feedback using some academic vocabulary. Student provides constructive feedback using the cues. Student could have incorporated more academic vocabulary in their responses to the prompts to display a deeper understanding of the skill.
3	Student scores his or herself based on the rubric above. Student displays limited knowledge of the cues for the backhand. Constructive feedback references cues and academic vocabulary very little. Student displays some knowledge of the backhand, but not a deep understanding.
2	Student scores his or herself based on the rubric above. Student does not use academic vocabulary in his or her response. Student is able to display some feedback, but feedback could use more guidance. Feedback needs to reference the cues. Shows very limited understanding of the material.
1	Student scores his or herself based on the rubric above. Student provides little to no feedback for his or herself. Student responds to the prompts, but not by referencing the cues and academic vocabulary. Student is attempting to answer the prompts, but does not show an understanding of the skill.

Lesson 2 Closure Assignment: The Backhand Self-Assessment

Name _____ Per. _____ Date _____

Directions: Respond to the prompts using the academic vocabulary and academic language taught in today's lesson.

1. Score yourself on the checklist rubric below. Place checkmarks in the boxes for each cue you were able to perform. Add the checkmarks up and place the number in the total score column.

Daily Learning Objective Checklist: Two handed Backhand Rubric	Continental Grip/ Two handed	Watch the ball	Perpendicular to target	Step in Opposition/ Transfer weight	Swing low to high	Follow Through	Total Score
Student Name							

2. Why do you believe you earned that score?
3. What can you do to perform the backhand better? Were there any cues that you could perform better? Were there any cues that you felt comfortable performing?
4. What was the most difficult cue of the backhand and why?

Lesson 3: Learning Segment Central Focus or “Big Idea”:

The central focus of this learning segment is to get students to be able to play in a competitive groundstroke rally. The focus of this specific lesson is to begin rallying with a partner using both the backhand and forehand groundstrokes. Students must be able to identify the appropriate times to use a forehand and a backhand in this lesson. Students will also be able to summarize learning during a closure quick write.

Grade: 9**Content Area: Physical Education/Tennis****TEACHER: Mr. Jaymot****Students: 47****Time Allotted: 60 Minutes****Classroom organization:**

5. Roll call numbers
6. Gymnasium
7. The tennis courts

Resources and materials: 50 tennis racquets, 100 tennis balls, 10 green dot balls, 10 foam balls dry-erase marker, portable white board, tennis backboard or a long wall, rally rubric spreadsheet, closure assessment, 50 pencils, ball hoppers or buckets, projector, screen or blank wall, caution tape

California Content Standard(s):

1.2 Demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.

1.3 Identify, explain, and apply the skill-related components of balance, reaction time, agility, coordination, explosive power, and speed that enhance performance levels in aquatic, rhythms/dance, and individual and dual activities.

3.9 Recognize and evaluate the role of cooperation and positive interactions with others when participating in physical activity.

CCCSS ELD Standards:

ELD Standard (Speaking/Listening)

SL.9-10.1, 6; L.9-10.3, 6 Exchanging information and ideas with others through oral collaborative discussions on a range of social and academic topics.

SL.9-10.1, 3, 6; L.9-10.1, 3, 6 Listening actively to spoken English in a range of social and academic contexts

ELD Standard (reading/writing)

W.9-10.4-5: WHST.9-10.4-5; SL. 9-10.4, 6; L.9-10.1, 3, 5-6 Selecting and applying varied and precise vocabulary and other language resources to effectively convey ideas

W.9-10.4-5; WHST.9-10.4-5; SL.9-10.6: L.9-10.1, 3, 6 Adapting language choices to various contexts (based on task, purpose, audience, and text type)

Objectives:

Psychomotor Objectives:

Students will be able to perform a tennis rally using the forehand and backhand groundstrokes during drills and modified gameplay (rally).

Cognitive Objectives:

Students will be able to identify the essential psychomotor cues of the forehand and backhand groundstrokes during drills, modified gameplay and closure.

Students will be able to identify when to use each groundstroke (forehand and backhand) during a rally.

Affective Objectives:

Students will be able to display good sportsmanship through positive interactions with others during class activities.

Prerequisites/Prior learning

13. Groundstroke - a stroke used to strike the ball after it has bounced on the ground
14. Swing low to high – swinging from underneath the ball to over the ball
15. Stepping in opposition/weight transfer – stepping with the opposite foot of the primarily used hand (in the forehand the dominant hand is the primary hand so for a righty they would step with their left foot first to transfer weight in the direction of their target)
16. Perpendicular to target – turning your side to target
17. Follow through – continuing one's movement after the ball has been struck (in this case up towards the opposite shoulder)
18. Bevels on a racquet

19. Non-dominant hand – the hand that is least preferred when performing fine and gross motor tasks
20. Two-handed backhand – a groundstroke that is often used around the baseline after the ball has bounced once. This stroke is used when the ball is traveling towards the side associated with your non-dominant hand
21. Continental Grip – also known as the hammer or axe grip, this is the grip used by the dominant hand when performing a two-handed back hand and will also be used for the volley in future tennis learning segments

Making Content Accessible: (PACT rubrics 1, 2)

- This lesson revolves around reviewing the previous lessons and building on that knowledge. The previous lessons (the forehand and backhand groundstrokes) will be used as a scaffold in order to have students use these skills to begin a groundstroke rally. To build interest, a youtube highlight reel of the “best tennis points” is incorporated into the lesson as an anticipatory set. Students will be able to identify some of the skills and cues occurring in the video. The video also provides a scaffold for what a “rally” is which represents our academic vocabulary for the lesson. A review session on a white board and a teacher and peer demonstration will provide a cognitive objective review. The learning tasks (drills) will allow students to practice the psychomotor skills (backhand and forehand). Now that students are going to begin rallying, sportsmanship elements will be added to our lesson assessments, such as “student shakes opponents/partners hand after activity”.
- This lesson is a pure review of the previous lessons and the only new academic vocabulary is the concept of a rally. This lesson acts as a support for students who struggled in the previous lessons with academic vocabulary as students now have the chance to repeat all of the information from the previous two lessons.
- Gardner’s Theory of Multiple Intelligences informed my decisions for the entire learning segment and that includes this lesson. Students with different optimal intelligences benefit from the teacher and peer demonstrations, video highlights, white board text representations, and verbal instructions.
- Bandura’s Observational Learning Theory became increasingly important as we get deeper into the learning segment. For the first lesson, Garner’s Theory of Multiple Intelligences was the main focus, but as the class progresses Observational Learning becomes increasingly important. Videos of the skills, teacher demonstrations, and peer demonstrations become of greater importance.
- Additional to students learning from observing others, I strongly believe that students learn by doing. Learning by doing is strongly supported by John Dewey. He strongly believed that knowledge comes from experience. Throughout the lesson segment students are provided opportunities to perform skills and through those experiences students gain knowledge and an

understanding of the content. Jerome Bruner, a theorist that built upon Dewey's ideals, created Constructivism. Constructivism is built around the idea that individuals actively construct knowledge by comparing new ideas with what the knowledge they already possess. The class has covered the forehand and backhand (which represents prior knowledge at this point) and now we are going to build on those skills by learning how to conduct a rally.

- Students will compare and contrast their individual strengths and weakness when considering what their favorite groundstroke is (backhand or forehand) during our closure activity. Students will have to elaborate on why this skill is their favorite. Students will also summarize their learning as they must breakdown the elements of their favorite groundstroke during our closure activity.

Academic language demands:

- The students at Richmond High School demonstrate many language needs. According to the 2015-2016 School Accountability Report Card 39% of students are meeting or exceeding the state standards in English Language Arts. This is behind the state average of 48% of students meeting or exceeding the state standards in English Language Arts. 38.1% of the student body consists of English Learners, which presents a challenge for teaching and learning. Although many students' test scores present them as non-proficient in the language, many of the students are proficient in conversational and spoken English. Their ability to communicate in conversational English is a huge language strength. Syntax, grammar, language structure, and other writing conventions are a challenge for students. The largest group of ELs speaks Spanish. Most of these students are newcomer students. The majority of these students come from Mexico and Central American Countries. A small percentage of the newcomer students come from South East Asian countries. A language strength is that a large population of the students are bilingual and are very helpful in scaffolding academic content and material.
- The majority of my class is proficient enough in English to comprehend the academic language for this lesson. These students could perform the following lesson without the text representation on a white board and without Total Physical Response. These students could probably perform all of the learning tasks simply by observing the teacher demonstrate the skill, but I believe all of the mediums incorporated into the lesson truly aid in the understanding of the material. Students who are not proficient in English are fully capable of understanding the academic vocabulary by the end of the lesson with all of the scaffolds that are incorporated in the lesson.
- I do have 9 students classified as English Language Learners (all of these students are classified as beginner or early intermediate in all mediums, reading, writing, and speaking). I also have 3 students with IEPs and 1 student on a 504 plan. These students do not necessarily struggle with the academic language in physical education, but they definitely benefit from many of the strategies that I perform for me English Language Learners (as do most students).

These students sometime require additional time for their exit tickets during closure and some additional demonstration and modeling.

- A language strength in my class is that the majority of the population is Hispanic and bilingual. This is a huge benefit as these bilingual students are great in aiding with the English Language Learners and help assure that the English learners are understanding the content and lesson objectives.
- The students are not familiar with a lot of the vocabulary that will be covered in the lesson. There is some prior learning that has occurred, but there is a lot of academic language in tennis and because of this I have included many mediums in order to assure student learning. The essential vocabulary is listed below.
- There will be many academic language supports in place such as Guided Language Acquisition Strategies (GLAD) and Specially Designed Academic Instruction in English (SADIE) strategies. Visuals, text representation, opportunities for students to produce the words in written and oral formats, modeling, and demonstrations are included throughout the lesson.
- Lesson three will be light on new academic vocabulary as this lesson will help build off previous lessons by repeating the academic vocabulary. This will also scaffold the previous material prior to taking the next step in the progression of tasks, which is participating in a groundstroke rally.
- The language strengths of the students are that the students have already been familiarized with the academic vocabulary in the previous two lessons. This lesson includes learning tasks that review the forehand and backhand prior to a groundstroke rally. Some students may need help with some of the academic language from the previous two lessons and this lesson acts as a catalyst in allowing them another opportunity to comprehend the academic language of the lesson segment. White board text representation, demonstrations, modeling, student pairing, and TPR will be present scaffolds for students with additional language needs.
- The academic language demands of this particular lesson are not too difficult. Some students may struggle with using academic vocabulary in the closure assessment when referencing past lessons. I will have the academic vocabulary listed on a white board and model some sample answers to questions to help struggling students comprehend the assignment.

List essential vocabulary.

1. Rally – an exchange of strokes between players

Assessment:

All of the assessments that will be used are formative assessments. The teacher will provide the following assessments as a means to assess student learning as the class progresses through the lesson (and unit). The assessments are low stakes by themselves, but add up and the culmination of these assessments will determine the students' grade for the lesson. If there are areas that the majority of the class is not comprehending, the teacher will eliminate these from the grading and review the content with the class because student learning and comprehension is a reflection of the teacher. During the ball toss activity and rally I will be circulating the tennis facility in order to provide feedback. During the ball toss activity, students are performing psychomotor skills that have been reviewed in the prior two lessons, this allows me some time to provide individualized feedback to students that have been struggling with the psychomotor aspects of the lesson. I always refer to the cues when providing feedback as this models academic language use to the students.

- Rally Rubric – Students will be assessed on a rubric that can be seen at the end of the lesson plan. The rubric will assess elements that lead to the psychomotor objectives (backhand/forehand) and affective objectives (sportsmanship). This is an informal assessment that is content and performance focused.

- Closure Quiz (Cognitive Assessment)
 - The students will be assessed with open ended questions during a closure activity where students will be expected to use academic language elicit deeper level thinking about the skills. Students should also be able identify the appropriate cues for their favorite groundstroke. This will assess if we are reaching our cognitive objectives of the class.

Instructional Sequence:

5 Min.	Dress & Attendance
5 Min.	Dynamic Warm-up • Short self-paced jog • High Knees • Butt Kicks

	• Groin Stretch • Lunges with a twist • Trunk Twist • Arm Circles (Big, Small, Forwards, and Backwards)
8 Min.	Anticipatory Set The teacher will scaffold on previous lessons by projecting a “best tennis points” highlight video by. The video will grab interest of students, access prior knowledge from yesterday as students will be able to identify forehand and backhand cues, and ultimately help lead students to our learning objectives. Students will have a brief moment to share ideas and thoughts with a partner after watching the video. The video is on youtube and the URL is: https://www.youtube.com/watch?v=xdBa_UpiQG4
7 Min.	Forehand and Backhand Cue Review and Model • Teacher will review the forehand and backhand groundstrokes by modeling the psychomotor cues of the forehand and backhand groundstrokes and the proper grips for each. All of the cues will be written on a portable white board • The teacher will also allow for peer demonstration and observation. • Teacher will also mention when to use a backhand and forehand. This concept is fairly easy as anything that goes to the dominant hand side should be a forehand and anything that goes to an individual’s non-dominant hand should be a backhand. Usually when a ball is going at a beginner’s body, they should run around the ball to hit a forehand. • Eastern Grip for the forehand • Continental Grip for the backhand 1. Watch the ball 2. Perpendicular to target (Side to target) 3. Swing from low to high 4. Transfer weight by stepping in opposition 5. Make contact with the ball to the side and out in front of you and follow through across your body and up towards the opposite shoulder.

10 Min.	Ball Toss Groundstrokes In this activity students will be paired up. One student will be designated to perform an underhand toss to their partner (from the side of the court for safety reasons). This displays a progression of task as we are now attempting to hit a ball coming in our direction. Their partner will use the cues of the forehand and backhand groundstrokes to perform the appropriate groundstroke. Students will switch roles every 15 balls.
15 Min.	Modified Gameplay - Partner Rally In this activity all students will be assigned a partner or group by the teacher, The teacher may periodically switch students to work with new partners or groups. Once everyone has a partner or group assigned to them the teacher will provide a brief definition of what a “rally” is followed by a demonstration of a rally with one of the excelling students in class. Students will then find a tennis court and participate in rally gameplay. If courts are limited the teacher will place caution tape between court posts to extend the playing area. This is okay as students will be attempting to participate in a rally and not trying to compete for points yet. Modifications include enforcing excelling students to strike the ball within one bounce, may hit the ball harder, and may scoot further back. Struggling students may scoot forward, use foam balls or low compression balls, and can allow the ball to bounce as many times as they need before performing a forehand groundstroke. Students should be attempting to utilize the cues provided by the teacher while keeping a rally with a partner. At the end of the rally segment of class students will shake their partner/opponents hands and provide positive feedback as well as identify one strength of their partner and compliment them on that strength.
5 Min.	Closure Quick Write Learners will demonstrate their learning and reflect on what they have learned by answering a series of open ended questions. This assignment will give students a forum to display their knowledge and if they are meeting the lesson objectives. These are the questions that will be on the worksheet. • What is a rally? • What makes an individual good at a rally? • What groundstroke is your favorite and why? • What are some of the essential components of your favorite groundstroke?

5 Min.	Dress
	Reflection: Monitoring student progress and reflecting on learning (Pact rubrics 7, 8, 9, 10) • The instructional strategies reflected attention to student needs in a variety of ways. Observing my student body, I have a large number of EL students and a few IEP/504 students. These students benefit from multiple modalities. The videos, visuals, modeling, demonstrations, and text representations really helped these students perform quality work. These modalities also helped students be successful at reaching objectives. These modalities were supported by the work of Gardner and Bandura. • Gardner’s Theory of Multiple Intelligences informed my decisions for the entire learning segment and that includes this lesson. Students with different optimal intelligences benefitted from the teacher and peer demonstrations, video visuals, white board text representations, and verbal instructions. • Bandura’s Observational Learning Theory became increasingly important throughout learning segment. Videos of the skills, teacher demonstrations, and peer demonstrations provided opportunities for observation. • Rallies can be difficult for some students to perform as a ball coming at them gives them very little time to prepare their groundstroke. Due to the increased difficulty, I had a variety of balls (such as foam tennis balls and low compression green dot tennis balls) available that students could use to ease the process. The ball modifications made huge differences in the capabilities of students to participate in a rally. Also students can be as close or as far from the net as possible for this lesson. One aspect of the rubric assures they can “rally” or keep the ball going back and forth. All of the modifications assured that everyone in the class could perform the activity. I enjoy providing a lot of activity time for students as this provides students with an opportunity to learn by doing (Dewey). Also, students are able to build on the past two lessons (the forehand and backhand) to construct a rally. This active adding of ideas to prior knowledge (the new idea being a rally in this lesson) is reminiscent of constructivism and Jerome Bruner as we have been teaching skills to add up to students becoming capable of a rally. • Other than providing modifications for individuals and subgroups in the class, I provided feedback to assure students are understanding the objectives. Students that struggled in the previous two lessons were the focus of this lesson. This lesson reviewed the skills for some students and for others rallying was the focus as rallying is a great (and enjoyable) progression in learning. Additional modeling and references to the cues will occur for students who were struggling. • Everyone in the class was able to sustain a rally (even if it was only briefly). Students also conducted themselves with great sportsmanship. As this was a review lesson of the

	skills (with the addition of the rally) the cognitive closure assessment went well. Students were able to identify cues and use academic vocabulary much better than in previous lessons. The next step in learning is teaching students how to volley so that they can have another tool in the arsenal of skills to use during a rally.
--	--

Rally Rubric	
4	Student displays competency in both forehand and backhand groundstrokes. Student displays good decision making when deciding on when to perform a forehand or backhand. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
3	Students displays competency in one of the two groundstrokes. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
2	Student displays an understanding of some of the cues of the psychomotor skills, but is not competent in any of them. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
1	Student does not display competency in either groundstroke and does not demonstrate an understanding of the cues. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.

Closure Quick Write Rubric	
4	The criteria to obtain a full score on this assessment is the following. Student defines what a rally is. Student provides a response with reasoning to what makes an individual good at rallying. Student identifies a favorite groundstroke and explains why it is his or her favorite. Student is able to identify two or more cues of their favorite groundstroke.
3	Student is missing one of the above criteria.
2	Student is missing two of the above criteria.
1	Student is missing three or more of the above criteria.

Lesson 4: Learning Segment Central Focus or “Big Idea”:

Students will be able to participate in modified tennis gameplay (a rally) with a partner. The focus of this specific lesson is to add volleying to the students’ arsenal of tennis skills. Students should know how to perform the forehand and backhand groundstrokes and after this lesson should be able to perform the volley. Students will have to critically think about when a volley is appropriate rather than a groundstroke.

Grade: 9**Content Area: Physical Education/Tennis****TEACHER: Mr. Jaymot****Students: 47****Time Allotted: 60 Minutes****Classroom organization:**

8. Roll call numbers
9. Gymnasium
10. The tennis courts

Resources and materials: 50 tennis racquets, 100 tennis balls, 10 green dot balls, 10 foam balls dry-erase marker, portable white board, tennis backboard or a long wall, daily learning objective rubric spreadsheet, closure assessment, 50 pencils, ball hoppers or buckets, gymnasium, projector, screen or blank wall

California Content Standard(s):

1.2 Demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.

1.3 Identify, explain, and apply the skill-related components of balance, reaction time, agility, coordination, explosive power, and speed that enhance performance levels in aquatic, rhythms/dance, and individual and dual activities.

3.9 Recognize and evaluate the role of cooperation and positive interactions with others when participating in physical activity.

CCCSS ELD Standards:

ELD Standard (Speaking/Listening)

SL.9-10.1, 6; L.9-10.3, 6 Exchanging information and ideas with others through oral collaborative discussions on a range of social and academic topics.

SL.9-10.1, 3, 6; L.9-10.1, 3, 6 Listening actively to spoken English in a range of social and academic contexts

ELD Standard (reading/writing)

W.9-10.4-5: WHST.9-10.4-5; SL. 9-10.4, 6; L.9-10.1, 3, 5-6 Selecting and applying varied and precise vocabulary and other language resources to effectively convey ideas

W.9-10.4-5; WHST.9-10.4-5; SL.9-10.6: L.9-10.1, 3, 6 Adapting language choices to various contexts (based on task, purpose, audience, and text type)

Student Learning Objectives:

Psychomotor Objectives:

Students will be able to perform a volley during drills and modified gameplay (rally).

Cognitive Objectives:

Students will be able to identify the essential psychomotor cues the volley during drills, gameplay, and assessment.

Students will be able to compare and contrast volley cues with groundstroke cues during closure.

Affective Objectives:

Students will be able to engage in and maintain a positive, safe, and nonthreatening environment during instruction and gameplay.

Students will be able to cooperate with others in a positive manner during drills and gameplay.

Making Content Accessible

- In this lesson I will draw on students previous knowledge by using the backhand lesson as a scaffold. The backhand grip that was taught was the continental grip. This grip is actually used as the volley grip as well. Also, comparing a racquet to a hammer or axe is a great way to demonstrate this grip and the imagery behind this really helps students comprehend the skill.
- The educational theories that underpin this lesson are Gardner's Theory of Multiple Intelligences and Bandura's Observational Learning Theory. Gardner's Theory of Multiple Intelligences supports the design of this lesson as I use multiple mediums and modalities to reach all students optimal intelligence. One of the most commonly used way of teaching skills in physical education is demonstration/modeling. Modeling allows students to observe and learn the skills.

- Dewey's Learning by Doing is also incorporated now. Students are beginning to learn through experience and they are becoming more actively engaged in drills and activities at this point.
- Students will have the opportunity to summarize learning on a graphic organizer during closure. The graphic organizer focuses on comparing and contrasting the volley skill with groundstrokes.
- Students who struggle with academic vocabulary will have many opportunities to learn the vocabulary. Text representation, observation, modeling, videos, individualized feedback during activity and total physical response represent some of the scaffolds in this lesson.

Prerequisites/Prior learning

22. Groundstroke - a stroke used to strike the ball after it has bounced on the ground
23. Watch the ball
24. Swing low to high – swinging from underneath the ball to over the ball
25. Stepping in opposition/weight transfer – stepping with the opposite foot of the primarily used hand (in the forehand the dominant hand is the primary hand so for a righty they would step with their left foot first to transfer weight in the direction of their target)
26. Perpendicular to target – turning your side to target
27. Follow through – continuing one's movement after the ball has been struck (in this case up towards the opposite shoulder)
28. Two-handed backhand – a groundstroke that is often used around the baseline after the ball has bounced once. This stroke is used when the ball is traveling towards the side associated with your non-dominant hand
- 29.** Continental Grip – also known as the hammer or axe grip, this is the grip used by the dominant hand when performing a two-handed back hand and will also be used for the volley in future tennis learning segments
- 30.** Rally – an exchange of strokes between players

Academic language demands:

- The students at Richmond High School demonstrate many language needs. According to the 2015-2016 School Accountability Report Card 39% of students are meeting or exceeding the state standards in English Language Arts. This is behind the state average of 48% of

students meeting or exceeding the state standards in English Language Arts. 38.1% of the student body consists of English Learners, which presents a challenge for teaching and learning. Although many students' test scores present them as non-proficient in the language, many of the students are proficient in conversational and spoken English. Their ability to communicate in conversational English is a huge language strength. Syntax, grammar, language structure, and other writing conventions are a challenge for students. The largest group of ELs speaks Spanish. Most of these students are newcomer students. The majority of these students come from Mexico and Central American Countries. A small percentage of the newcomer students come from South East Asian countries. A language strength is that a large population of the students are bilingual and are very helpful in scaffolding academic content and material.

- The majority of my class is proficient enough in English to comprehend the academic language for this lesson. These students could perform the following lesson without the text representation on a white board and without Total Physical Response. These students could probably perform all of the learning tasks simply by observing the teacher demonstrate the skill, but I believe all of the mediums incorporated into the lesson truly aid in the understanding of the material. Students who are not proficient in English are fully capable of understanding the academic vocabulary by the end of the lesson with all of the scaffolds that are incorporated in the lesson.
- I do have 9 students classified as English Language Learners (all of these students are classified as beginner or early intermediate in all mediums, reading, writing, and speaking). I also have 3 students with IEPs and 1 student on a 504 plan. These students do not necessarily struggle with the academic language in physical education, but they definitely benefit from many of the strategies that I perform for me English Language Learners (as do most students). These students sometime require additional time for their exit tickets during closure and some additional demonstration and modeling.
- A language strength in my class is that the majority of the population is Hispanic and bilingual. This is a huge benefit as these bilingual students are great in aiding with the English Language Learners and help assure that the English learners are understanding the content and lesson objectives.
- The academic demand of this lesson are probably the simplest of the entire lesson segment. The volley has the least cues and is often the easiest skill to use. The continental grip was introduced in lesson two and that will be used as a scaffold for the volley as the grips are the same.
- Teacher demonstrations, student demonstrations, visuals, text representation on a white board, and TPR will all be used to scaffold for students who struggle with academic language whether they are ELs or general population students.
- Scaffolds for ELD students include: Demonstration, kinesthetic scaffolding, visual scaffolding, verbal scaffolding, giving them the opportunity to use the academic vocabulary on an exit ticket, opportunities to communicate with each other verbally, and total physical

response. Also, students will be paired with bilingual partners to address the language needs of students.

- The new problematic vocabulary in this lesson are the volley cues. Three of the 6 cues have been parts of other skills (forehand and the backhand), but there are three new cues which could be a hefty amount of new information on students. The concept of a volley is relatively easy to understand and explain. The grip is the same grip that is used during performing a backhand (continental) which is a great way to scaffold prior knowledge.

List essential vocabulary.

- Volley – a strike of the ball made before it touches the ground
 - Watch the ball
 - Perpendicular to target
 - Step in opposition/Transfer Weight
 - Keep racquet up and arms out in front of your body
 - Maintain a “V” between your forearm and racquet
 - Chop high to low, down, and through the ball
- Continental Grip (for a volley) – commonly known as the chopper grip or hammer grip, this grip is obtained by holding the racquet as you would hold an axe or hammer. In this grip your base knuckle of your index finger belongs on the second bevel of the grip.

Assessment:

The assessments that will be used in this lesson are formative assessments. The lessons are directly related to the lesson objectives. The assessments display a student’s progress towards the objectives. I will know that students have met the objectives if they perform well on the assessments and display comprehension of the material. The daily learning objective checklist rubric is actually an embedded assessment. This checklist actually pinpoints what students are capable of performing and pinpoints areas that they are struggling with. This is not only a great way to see students’ progress towards the objectives, but is also great in identifying areas where students could use individualized feedback. Feedback will be positive and directly related to the cues, academic vocabulary, and academic language of the lesson. I typically model and demonstrate feedback as this helps with student understanding of the material and student performance.

- Volley Rubric (Daily Learning Objective Checklist)

Students will be able to demonstrate the appropriate tennis grip for the skill, the cues, and sportsmanship throughout the lesson. All of these will be included on the rubric. The cues will

represent the majority of the rubric. The checklist allows me to provide timely feedback as I am looking for students to perform the cues and I can see what they are performing correctly and what they are not performing correctly. This is an informal assessment that is content and performance focused.

- Closure Graphic Organizer

On the closure graphic organizer students will elicit deeper thinking while identifying the cues of the volley. These cues represent the academic language in this lesson. On the graphic organizer students will be able to compare and contrast current learning with past learning. I will review this rubric at the end of closure (after students have completed and turned the assignment in). I will provide written feedback on their assignments and return to them the following day.

I will know that students have met the standards/objectives based on their performance on the two assessments. The Volley Rubric will reveal what cues students excelled at and what students struggled with. This rubric also allots points for the affective objective that revolves around cooperation and positive interactions with others.

Instructional Sequence:

5 Min.	Dress & Attendance
5 Min.	Dynamic Warm-up • Short self-paced jog • High Knees • Butt Kicks • Groin Stretch • Lunges with a twist • Trunk Twist • Arm Circles (Big, Small, Forwards, and Backwards)
8 Min.	Anticipatory Set • Introduce the volley and define what it is. Display the video on tennis doubles (most of which displays volleys). The video can be found at: https://www.youtube.com/watch?v=NHcqM0gYWoE. • The video is shown as a video scaffold that builds interest among students. • After displaying the video, teach and demonstrate the skill.

	Students will have a brief moment to share their thoughts with a partner after watching the clip.
8 Min.	Teacher Demonstration - Teacher will demonstrate/model the psychomotor cues of the volley and model the appropriate grip for both right handed and left handed individuals. - Teacher will have student volunteers model the skill. - Teacher will then perform TPR with all of the students to assure they are understanding the skill. This can also be used as a check for understanding. - Teacher will have the cues written on the whiteboard. - Hammer Grip/Chopper Grip (Continental Grip) Cues: - Watch the ball - Perpendicular to target - Step in opposition/Transfer Weight - Keep racquet up and arms out in front of your body - Maintain a “V” between your forearm and racquet - Chop high to low, down, and through the ball Teacher will perform Total Physical Response by having the students practice the technique by mirroring the teacher as he verbally says the cues. The teacher will also have the students repeat the cues of the volley. Teacher will also go over how to volley if the ball goes to the backhand side. Students use the same cues, but use the backhand side of the racquet.
6 Min.	Toss and Volley with a Partner - The activity will be demonstrated by the teacher and by student volunteers. - EL students will be paired with bilingual students. - Each student will find or be assigned a partner.

	- One partner will be around the service line performing an underhand toss to about the shoulder level of their partner who will be standing on the opposite side of the court halfway in between the service line and the net. - Each partner will perform 20 volleys from a partner toss
8 Min.	Groundstrokes versus Volley Drill - Teacher will briefly demo - EL students will be paired with bilingual students. - Now we will transition from a partner toss to one partner on the baseline hitting groundstrokes against a partner practicing/performing a volley at the net. - Each student should have an opportunity to volley. - The teacher will cue when partners will switch roles.
10 Min.	3 Ball, 2 Ball Volley Game - This game will be modeled by the teacher and volunteers prior to starting the game. - Students will be paired strategically based on ability levels. - EL students will be paired with bilingual students. - There will be four students per tennis court. Three of the four students will have two balls and one student will have three balls. - The balls represent a team's "lives" in a sense. - Everyone begins on the baseline for the first point. - The student with three balls begins the first rally. The point is played out. - The team that wins the point charges the net (both students) to be in a volley position - The volley position is where you want to be to win the game - The team that loses races to the baseline and has to use one of their balls (their lives) to perform a hit to try to win the point against the two net players. - The team will play out the point. If the team that fed the ball wins the point they charge the net and become the net players while the losing team races to the baseline and must use one of their balls (lives). - If the volley team wins they remain at the net and their opponents must use another one of their balls (their lives) to start the rally. - When a team loses all of their balls, they lose the game.

	This can be conducted as a ladder tournament.
5 Min.	Consistent Rally - If there is time we will perform a consistency rally - Students should now know how to perform a forehand, backhand, and volley. All of these can be used during a rally to keep the ball traveling back and forth. We will go back to playing rally points tomorrow, but for the purposes of practicing all of the strokes we will attempt to keep the ball going back and forth for as long as possible - Students can keep count - Teacher may include a “count” objective or motivate students by asking the class to see which pair can hit the ball back and forth the most times.
5 Min.	Closure - Students will be provided a worksheet that poses one open ended question regarding the skill and a question regarding identifying the cues. - The third part of the worksheet will consist of a compare and contrast graphic organizer that requires students to compare and contrast the similarities and differences between the groundstrokes (forehand and backhand) and the volley. For example, the volley uses the continental grip, which is the same used for the backhand. All of the skills require that individuals turn their side to target. All of the skills require students to watch the ball. They are different because a groundstroke allows the ball to hit the ground before striking it which is different than a volley because a volley is when an individual strikes a ball prior to the ball hitting the floor. They are also different in that a volley chops high to low and groundstrokes swing from low to high.
5 Min.	Dress
	Reflection: Monitoring student progress and reflecting on learning (PACT rubrics 7, 8, 9, 10) Time management was a huge issue in performing this lesson. I over planned, somewhat knowingly, as students often find volleying to be one of the easier skills. I planned too many activities. I did not get to the consistency rally and cut the groundstroke versus volley drill short as I wanted to allow students enough time to get the closure assignment completed. This lesson could definitely have been split up into two lessons. I went back and retaught the lesson (in a condensed way skipping some of drills from the first attempt) and performed the 3 ball, 2 ball volley game and consistency rally prior to moving on to the final lesson in the learning segment (a competitive rally). I also had planned to provide feedback to the class on the closure assignment at the end of closure, but decided that I would do it in the retaught lesson as a scaffold of the skills. This worked well.

	• The instructional strategies in the lesson reflected attention to student needs by providing them with multiple opportunities to learn the material. For students that struggle with academic language and ELs there were a variety of scaffolds throughout the lesson. Visuals, teacher and peer models, academic vocabulary on a white board, small group and individual feedback and modeling to help with the skills, and strategically pairing students together all worked well as scaffolds. These scaffolds were used with Gardner's Theory of Multiple Intelligences and Bandura's Observational Learning Theory in mind. • Gardner's Theory of Multiple Intelligences informed my decisions for the entire learning segment and that includes this lesson. Students with different optimal intelligences benefitted from the teacher and peer demonstrations, video visuals, white board text representations, and verbal instructions. • Bandura's Observational Learning Theory became increasingly important throughout learning segment. Videos of the skills, teacher demonstrations, and peer demonstrations provided opportunities for observation. • In the lesson I had to adjust the positioning of some individuals during the ball toss drill. While circulating around the class I was able to provide feedback with the positioning on the court to help students be successful. Other than that, students were most receptive when I gave positive and corrective feedback to their small groups. This was really effective in allowing them to ask questions and perform the skill correctly. As students experienced the skills, they would learn by doing (Dewey) and have questions about their performance. • The individual feedback that I provided students revolved around the cues and academic vocabulary of the lesson. I often asked students to recall a cue or two to help them with the skill. If they could not recall, they were sometimes able to act it out. This displayed Dewey's Learning by Doing theory as students were literally learning by doing. Students were reaching the psychomotor objectives by experiencing the skills. One common mistake was the grip. Tennis is a game of changing grips depending on where you are on the court and I would ask what grip they should be using if they were using an inappropriate grip style. This happened often in 3 ball, 2 ball as you are constantly changing court positions from the baseline to the net (which means you must change grips). After posing questions I would provide additional demonstration and modeling for students as this seemed to be the most helpful feedback for students. I tried to provide more positive feedback after or before providing corrective feedback. The sandwich theory works well for me. A positive comment followed by corrective feedback and then I leave them with some kind of positive feedback.
--	--

	• Most students were able to pick up volleying in some shape or form fairly quickly. By the retaught lesson, everyone was able to perform the skill using the cues provided. I revisited the lesson the following day as I had poor time management when planning. The formative assessments guided the next steps. Since they were able to perform the skill well after day 2 we were ready for a competitive rally. At this point students displayed enough proficiency to conduct a competitive rally for the final lesson of the learning segment. The next lesson (final lesson of the first learning segment) will introduce a few of the court boundaries and have students participate in competitive rallies. The subsequent learning segment will introduce the serve, scoring and gameplay.
--	--

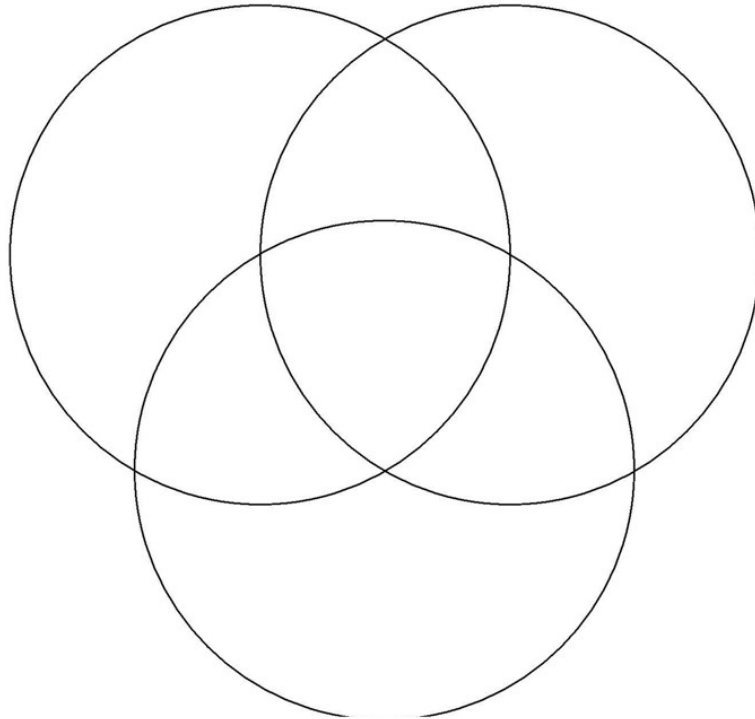

[illegible]

Students will compare and contrast the volley with the forehand and backhand groundstrokes on a graphic organizer. A cue bank will be provided. Three circles will be represented. Similarities should go in the middle. Differences remain solely in that skills circle.

Forehand	Backhand	Volley
1. Eastern Grip 2. Watch the ball 3. Perpendicular to target 4. Step in opposition 5. Swing low to high 6. Follow Through	1. Two handed Continental Grip 2. Watch the ball 3. Perpendicular to target 4. Step in opposition 5. Swing low to high 6. Follow Through	1. Continental grip 2. Watch the ball 3. Perpendicular to target 4. Step in opposition 5. Keep racquet up and arms out in front of your body 6. Chop high to low, down, and through the ball

Lesson 5: Learning Segment Central Focus or “Big Idea”:

The central focus of this learning segment was to get students to be able to play in a competitive tennis rally. This is the last lesson of the first lesson segment and students will have to draw from prior lessons in the learning segment to combine and apply movement skills into a competitive rally. Students will demonstrate proficiency in movements by referring back to the cognitive cues of the skills. Students will have to think quickly on court to compete in a rally. Creativity when placing the ball will become natural as students compete.

Grade: 9**Content Area: Physical Education/Tennis****TEACHER: Mr. Jaymot****Students: 47****Time Allotted: 60 Minutes****Classroom organization:**

11. Roll call numbers

12. The tennis courts

Resources and materials: 50 tennis racquets, 200 tennis balls, 20 foam balls, 20 low compression balls, dry-erase marker Portable white board, daily learning objective rubric spreadsheet, court identification handout, ball hoppers or buckets

California Content Standard(s):

1.1 Combine and apply movement patterns, simple to complex, in aquatic, rhythms/dance, and individual and dual activities.

1.2 Demonstrate proficient movement skills in aquatic, rhythms/dance, and individual and dual activities.

1.4 Explain and demonstrate advanced offensive, defensive, and transition strategies in aquatic and individual and dual activities.

3.9 Recognize and evaluate the role of cooperation and positive interactions with others when participating in physical activity.

CCCSS ELD Standards:

ELD Standard (Speaking/Listening)

SL.9-10.1, 6; L.9-10.3, 6 Exchanging information and ideas with others through oral collaborative discussions on a range of social and academic topics.

SL.9-10.1, 3, 6; L.9-10.1, 3, 6 Listening actively to spoken English in a range of social and academic contexts

ELD Standard (reading/writing)

W.9-10.4-5: WHST.9-10.4-5; SL. 9-10.4, 6; L.9-10.1, 3, 5-6 Selecting and applying varied and precise vocabulary and other language resources to effectively convey ideas

Student Learning Objectives:**Psychomotor Objectives:**

Students will be able to perform the forehand, backhand, and volley during competitive rally points.

Cognitive Objectives:

Students will be able to identify the essential psychomotor cues for the forehand, backhand, and volley during drills, gameplay, and assessment.

Students will be able to identify the court lines and understand how these lines are important in the tennis strategy of being a “pusher”.

Affective Objectives:

Students will be able to cooperate with others and display positive sportsmanship with classmates during class activities.

Making Content Accessible:

- This lesson has two parts to it. One is the actual rally section. This section of the lesson scaffolds from the previous three lessons as all of the skills are essential during a rally.
- I will have a visual scaffold provided for our court identification activity so that students can learn by observing. We will also do an activity on court. These activities will help students who struggle with academic vocabulary as students will be able visualize and observe.
- This lesson revolves around reviewing the previous lessons and building on that knowledge. The previous lessons (the forehand and backhand groundstrokes and the volley) will be used as a scaffold in order to have students use these skills to begin a competitive rally. Demonstrations will be provided of each skill. Individual and small group feedback will happen while I circulate the tennis facility. Now that students are going to begin rallying, sportsmanship elements will be added to our lesson assessments, such as “student shakes opponents/partners hand after activity”.
- Gardner’s Theory of Multiple Intelligences informed my decisions for the entire learning segment and that includes this lesson. Students with different optimal intelligences benefit from the teacher and peer demonstrations, video visuals, white board text representations, and verbal instructions.
- Bandura’s Observational Learning Theory became increasingly important as we get deeper into the learning segment. For the first lesson, Gardner’s Theory of Multiple Intelligences was the main focus, but as the class progresses Observational Learning becomes increasingly important. Videos of the skills, teacher demonstrations, and peer demonstrations become of greater importance.
- Additional to students learning from observing others, I strongly believe that students learn by doing. Learning by doing is strongly supported by John Dewey. He strongly believed that knowledge comes from experience. At this point in the lesson students should have enough competence in the material to perform the skills and will gain knowledge and an understanding of the content by performing the skills more and more during gameplay. Jerome Bruner, a theorist that built upon Dewey’s ideals, created Constructivism. Constructivism is built around the idea that individuals actively construct knowledge by comparing new ideas with what the knowledge they already possess. The class has covered the forehand, backhand, and volley (which represents prior knowledge at this point) and now we are going to build on those skills by learning how to compete in a rally for points.
- The learning processes used in this lesson revolve around knowing the psychomotor skills that have been taught in the previous lessons. The rubric that students are being assessed on allows students to summarize their learning throughout the lesson segment. Students will also think critically about how to use all of the skills during points as there are now court

boundaries included. I will introduce the “pushing” strategy (which is basically do not make mistakes/errors and get the ball back to your opponent and wait for them to make an error). The court identification assignment will allow students to summarize their learning on the court boundaries which is essential for creatively/critically thinking about tennis strategies.

Prerequisites/Prior learning

Forehand

1. Forehand Grip (Eastern) Review
2. Watch the ball
3. Perpendicular to target
4. Step in opposition and transfer weight
5. Swing low to high
6. Follow through

Backhand

1. Backhand Grip (Two-handed/Continental)
2. Watch the ball
3. Perpendicular to target
4. Step in opposition and transfer weight
5. Swing low to high
6. Follow through

Volley

1. Continental (Hammer) Grip
2. Watch the ball
3. Step in opposition and transfer weight
4. Maintain a “V” between your forearm and your racquet
5. Keep arms and racket up and in front of your body
6. Chop/punch down through the ball

Academic language demands:

- The students at Richmond High School demonstrate many language needs. According to the 2015-2016 School Accountability Report Card 39% of students are meeting or exceeding the state standards in English Language Arts. This is behind the state average of 48% of students meeting or exceeding the state standards in English Language Arts. 38.1% of the student body consists of English Learners, which presents a challenge for teaching and learning. Although many students’ test scores present them as non-proficient in the language, many of the students are proficient in conversational and spoken English. Their ability to communicate in conversational English is a huge language strength. Syntax, grammar, language structure, and other writing conventions are a challenge for students. The largest group of ELs speaks Spanish. Most of these students are newcomer students. The majority of these students come from Mexico and Central American Countries. A small percentage of the newcomer students come from South East Asian countries. A language strength is that a large population of the students are bilingual and are very helpful in scaffolding academic content and material.
- The majority of my class is proficient enough in English to comprehend the academic language for this lesson. These students could perform the following lesson without the text representation on a white board and without Total Physical Response. These students could probably perform all of the learning tasks simply by observing the teacher demonstrate the skill, but I believe all of the mediums incorporated into the lesson truly aid in the

understanding of the material. Students who are not proficient in English are fully capable of understanding the academic vocabulary by the end of the lesson with all of the scaffolds that are incorporated in the lesson.

- I do have 9 students classified as English Language Learners (all of these students are classified as beginner or early intermediate in all mediums, reading, writing, and speaking). I also have 3 students with IEPs and 1 student on a 504 plan. These students do not necessarily struggle with the academic language in physical education, but they definitely benefit from many of the strategies that I perform for me English Language Learners (as do most students). These students sometime require additional time for their exit tickets during closure and some additional demonstration and modeling.
- A language strength in my class is that the majority of the population is Hispanic and bilingual. This is a huge benefit as these bilingual students are great in aiding with the English Language Learners and help assure that the English learners are understanding the content and lesson objectives.
- The students are not familiar with a lot of the vocabulary that will be covered in the lesson. There is some prior learning that has occurred, but there is a lot of academic language in tennis and because of this I have included many mediums in order to assure student learning. The essential vocabulary is listed below.
- There will be many academic language supports in place such as Guided Language Acquisition Strategies (GLAD) and Specially Designed Academic Instruction in English (SADIE) strategies. Visuals, text representation, opportunities for students to produce the words in written and oral formats, modeling, and demonstrations are included throughout the lesson.
- The academic language demands of this lesson involve court boundaries. These are not extremely challenging and students should be able to scaffold learning from other sports as all sport courts/fields have boundary lines.
- Teacher demonstrations, student demonstrations, visuals, text representation on a white board, and TPR will all be used to scaffold for students who struggle with academic language whether they are ELs or general population students.
- Word banks will be provided to help students learning the language.
- This lesson presents problematic vocabulary in the form of court lines. The lines themselves are not that difficult to learn, but there is a lot of information that will be referenced and this is why the assessment will be formative on court identification. The true goal is to have students perform a competitive rally, so the out of bounds lines are the emphasis for this lesson. These terms will be continuously references as we continue into our next learning segment so there will be plenty of more opportunities for students to comprehend this material.

List essential vocabulary.

2. Singles sideline – the narrower out of bounds boundary on the side of the court when playing one on one
3. Doubles sideline – the widest out of bounds boundary on the side of the court used when playing two versus two
4. Baseline – the boundary line at the end of each court
5. Service line – a marked line on a tennis court that indicates the area in which serves must land

6. Center Service Line – the center line marked on a tennis court that indicates the area in which serves must land
7. Service box – The box that serves must enter to begin play during a match
8. Net – barrier of meshwork cord or rope strung between two posts to divide a court in half
9. Center mark – divides a tennis court in half, used to divide the court in half when determining what side a player is serving from
10. Alley – The area between the singles and doubles sideline
11. Pusher – a pusher is a defensive player that pushes back any shot they can chase down until their opponent makes an error

Assessment:

In this lesson many formative assessments will be utilized to measure students' progress towards the intended learning objectives. There will be a court identification diagram assignment during the lesson so that students are able to recognize court lines as we get into competitive rallies. These lines are essential in understanding the sport in the following learning segment. It is also important for students to be able to identify the court as students need to know how to use court boundaries strategically.

A second assessment will be a rubric that assesses the students' ability to rally and perform the forehand, backhand, and volley cues. This is going to be more of a summative assessment or final assessment of the lesson segment. The goal of the lesson segment was to be able to participate in a competitive rally. This assessment will observe students and their ability to perform all of the skills that are essential in a rally. See rubric at the end of lesson plan. This is an informal assessment that is content and performance focused.

In this lesson I will provide feedback by modeling and referencing cues from the previous lessons. At this point all feedback should be familiar with the students and really used as a scaffold to help students recall how to perform the psychomotor skills.

Instructional Sequence:

5 Min.	Dress & Attendance
5 Min.	Anticipatory Set Video on Court lines I anticipate that students do not know the parts of the court. I will display a video that identifies parts of the court. This video has text representation and highlights areas of the court for learners. This video is used as a scaffold. The video can be found at: https://www.youtube.com/watch?v=ertvINJBIXE
10 Min.	Rules Progression Step 1 and Court Identification Activity - Students will be provided with a blank diagram that has a tennis court on it. Students will be required to complete the diagram by identifying the court lines and boundaries. The boundaries will be covered in the anticipatory set. Students will have a word bank to pull from as a scaffold. - Teacher will review after time is permitted for students to fill in the blank. Teacher will also play the video again once the handouts are given to the students.

10 Min.	Forehand, Backhand, and Volley Skill Review Scaffold Teacher will demonstrate the skills and review the cues for each skill briefly. All of the skills will be presented on a white board along with their cues. Past visuals and posters will also be brought to class to help scaffold prior knowledge. Forehand 1. Forehand Grip (Eastern) 2. Watch the ball 3. Perpendicular to target 4. Step in opposition and transfer weight 5. Swing low to high 6. Follow through Backhand 1. Backhand Grip (Two-handed/Continental) 2. Watch the ball 3. Perpendicular to target 4. Step in opposition and transfer weight 5. Swing low to high 6. Follow through Volley 1. Continental (Hammer) Grip 2. Watch the ball 3. Step in opposition and transfer weight 4. Maintain a “V” between your forearm and your racquet 5. Keep arms and racket up and in front of your body 6. Chop/punch down through the ball
20	Competitive Rally Points (Strategy #1 Pusher Rally) The teacher will go over the first strategy with the students, which is pushing. Pushers are notorious for getting the ball back with little pace and waiting for their opponent to make an error. The court boundaries are important to know as the only thing you need to know as a beginning pusher is get the ball back and keep it in play longer than your opponent. This is the first strategy I am going over with the class as I want students to be as active as possible. • Team Singles – There will be two teams. Each team is on opposite ends of the court. Each team is in a single file line with one student on each team on the baseline. One student feeds the ball and a rally begins. Whoever wins the rally stays on, whoever loses rotates to the back of their team line. A player can win a max of 3 points before having to rotate to the back of their team’s line (3 and back rule). This game can be modified in a variety of ways to make it more or less competitive. A total team score can be set as a goal (i.e. 21 points, win by 2). • Team Doubles - There will be two teams. Each team is on opposite ends of the court. Each team has their team broken up into pairs/partners. One student feeds the ball and a rally begins. Whichever pair wins the rally stays on, whichever pair loses rotates to the back of their team line. A pair can win a max of 3 points before having to rotate to the back of their team’s line (3 and back rule). This game can be modified in a variety of ways to make it more or less competitive. A total team score can be set as a goal (i.e. 21 points, win by 2).

5 Min.	Closure - Students will demonstrate and reflect on their learning through performing a think-pair share regarding their experiences in a competitive tennis rally. - Students will share their least favorite skill and favorite skill with a small group. - Students will share their thoughts on court boundaries and the cues. - Students will be asked what they think of the pushing strategy.
5 Min.	Dress
	Monitoring student learning during instruction - I believe the learning segment went well overall. Lesson 5 was a lesson where students could display their summary of learning over the course of the learning segment during a rally. A competitive rally was the focus of the entire learning segment and the progression of learning tasks was appropriate to build students skills up to this level of gameplay. All of the scaffolds in prior lessons were helpful in the competency of skills. Fourth period is my best class in all domains, affective, psychomotor, and cognitive. There are individuals in my other classes that may not have been able to get the psychomotor coordination down as well as this class did. Nearly every student was able to compete. In the future I would place more of an emphasis on assuring students were on a court that was appropriate for their ability. The best court consisting of the best athletes and the worst court consisting of the students who are struggling and/or are lazy. This lower end court could use a foam ball or green dot ball as a modification so they can enjoy rallying as much as the top court. - One of my biggest concerns is that our facility only has four tennis courts and that is not many courts for 47 students. Working out a rotation went well, but I need to come up with a strategy to get more students active simultaneously. Now that we are playing competitive rally points it is difficult to use caution tape to extend our nets since we are trying to play within the boundaries of the court. There was a plus side to students having down time though. I was able to provide feedback to individuals and small groups to help them compete better in a rally. In the future though, I really like the idea of doing stations so that physical activity is the focus. This lesson was really enjoyable for most still. - This lesson reflected attention to student needs by providing multiple scaffolds. All of the skills were modeled by the teacher again along with the cues being represented on a white board for all of the skills. A video was incorporated in the lesson as a way to provide a visual to the academic vocabulary of the lesson. Individual feedback was provided as well as I circulated the facility. A lot of individual modeling was useful in student understanding. - Gardner's Theory of Multiple Intelligences informed my decisions for the entire learning segment and that includes this lesson. Students with different optimal intelligences benefit from the teacher and peer demonstrations, video visuals, white board text representations, and verbal instructions.

	• Bandura's Observational Learning Theory became increasingly important as we got deeper into the learning segment. Videos of the skills, teacher demonstrations, and peer demonstrations provided opportunities for observation. • The assessments (especially of previous lessons) helped me identify students that needed additional assistance. I targeted students who struggled with essential skills first and provided them with feedback to help them with rallying. • I mainly provided modeling examples as feedback as well as cues to skills. I also made some recommendations that it is okay for students to favor one groundstroke during a rally, for example, many students struggle with a backhand during a live rally so I recommended running around the ball and performing more forehands than backhands. This helped with their ability to rally. • The evidence collected on the rubric for today indicated that some students are ready for the next skill (serving). I believe that we should spend more time on rallying (another day or two) prior to going into our next lesson segment which is teaching serving, scoring, and match play. I believe one more day of rallying will lead to much more competitive matches towards the end of our unit.
--	--

Final Rally Rubric	
5	Students is able to show competency in all three (forehand, backhand, volley) of the psychomotor skills by displaying the cues of each skill (not being graded on the product, but rather the process) during a rally. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
4	Students is able to display competency in two of the three psychomotor skills. Student struggles with one of the skills during a rally. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
3	Student is able to show competency in at least one of the three psychomotor skills. Student can perform the majority of cues for a second psychomotor skill, but is not competent. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
2	Student only shows competency in one psychomotor skill or an effort to perform the cues of the skill. Student is not capable of the other two skills. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
1	Student is not competent in any of the psychomotor skills. Student is not performing any cues. Student displays sportsmanship and positive interactions by shaking hands with an opponent and providing a compliment at the end of the lesson.
